The authors have done an exceptional job in simplifying
the art of arthroscopic management of distal radius
fractures. It is certainly a good resource for a surgeon to
read and perhaps limit technical difficulties and
complications. (Rosie Sender, Journal of Hand Surgery,

We recently described a technique 65 for the management
of arthroscopic volar lunate facet fractures of the distal
radius . The fracture is approached dorsally and the 3-4
portal is used for visualization, whereas the 5-6 and 6-R
portal are used for instrumentation.

Arthroscopy has the advantage of providing a direct and
accurate assessment of the articular surfaces and detecting
the presence of injuries associated with distal radius
fractures.

Abstract. The vast majority of fractures of the distal radius can reliably be treated with conventional methods, but for certain intra-articular fractures, especially those with depressed and impacted central fragments, arthroscopy-assisted reduction may significantly reduce the surgical trauma.

We retrospectively evaluated 27 consecutive patients with distal radial fractures, who satisfied the inclusion criteria of articular injuries in young and high-demand patients and who were managed with arthroscopic-assisted stable fixation of distal radius.

INTRODUCTION

Fractures of Distal Radius: An Overview

In 2008, Lutsky et al. did arthroscopic assessment in all patients undergoing open reduction and internal fixation and observed that a volar approach, indirect reduction and locked plate fixation is a useful technique in restoring articular congruity after distal radius fracture. They also stated that the magnitude of step and gap deformity may be underestimated by fluoroscopy.
