## [Entity Framework Fluent API - Configuring and Mapping ...](#)

When working with Entity Framework Code First the default behavior is to map your POCO classes to tables using a set of conventions baked into

### [Fluent API in Entity Framework Core](#)

In Entity Framework Core, the `ModelBuilder` class acts as a Fluent API. By using it, we can configure many different things, as it provides more configuration options than data annotation attributes. Entity Framework Core Fluent API configures the following aspects of a model: Model Configuration. Configures an EF model to database mappings.

### [Entity Framework Fluent API - Relationships](#)

Updated: October 23, 2016. Note: This page provides information about setting up relationships in your Code First model using the fluent API

### [Fluent API in Entity Framework 6](#)

Fluent API Configurations in EF 6: Entity Framework. Fluent API is used to configure domain classes to override conventions. EF Fluent API is based on a Fluent API design pattern (a.k.a. Fluent Interface) where the result is formulated by method chaining.

### [Entity Framework - Fluent API - tutorialspoint.com](#)

Fluent API is an advanced way of specifying model configuration that covers everything that data annotations can do in addition to some more advanced configuration not possible with data annotations. Data annotations and the fluent API can be used together, but Code First gives precedence to Fluent API > data annotations > default conventions.

### [Entity Framework Fluent API - yangan - - cnblogs.com](#)

Entity splitting allows the properties of an entity type to be spread across multiple tables. In the following example, the Department entity is split into two tables: Department and DepartmentDetails. Entity splitting uses multiple calls to the Map method to map a subset of properties to a specific table.

### [NHibernate for Entity Framework Developers: Part 1](#)
