Fracture - Wikipedia

A fracture is the separation of an object or material into two or more pieces under the action of stress. The fracture of a solid usually occurs due to the development of certain displacement discontinuity surfaces within the solid. If a displacement develops perpendicular to the surface of displacement, it is called a normal tensile crack or simply a crack; if a displacement develops tangentially to the surface of displacement, it is called a shear crack, slip band, or dislocation.

The effect of temperature on the fracture mechanism in ...

Three typical modes of high-temperature tensile fracture: (a) rupture, (b) transgranular creep fracture and (c) intergranular creep fracture. Rupture is generally associated with dynamic recovery and/or recrystallization.
