On some applications of diophantine approximations

Our results show that values of E-functions at rational points have measures of diophantine approximations typical to almost all numbers. In particular, any such number has the  $2 + \epsilon$  exponent of irrationality:  $-p/q > q^{-2-\epsilon}$ .

for relatively prime rational integers  $p, q$ , with  $q > 0$  ( $< 0$ ).

Diophantine approximations: how well a given (irrati-onal) number can be approximated by rational numbers, when the quality of approximation is given in terms of denominator of the rational numbers. The classical Dirichlet's theorem says that for any irrational number there exist in nitely many rational numbers  $p/q$  such that  $|p/q - \alpha| < 1/q^2$ .
